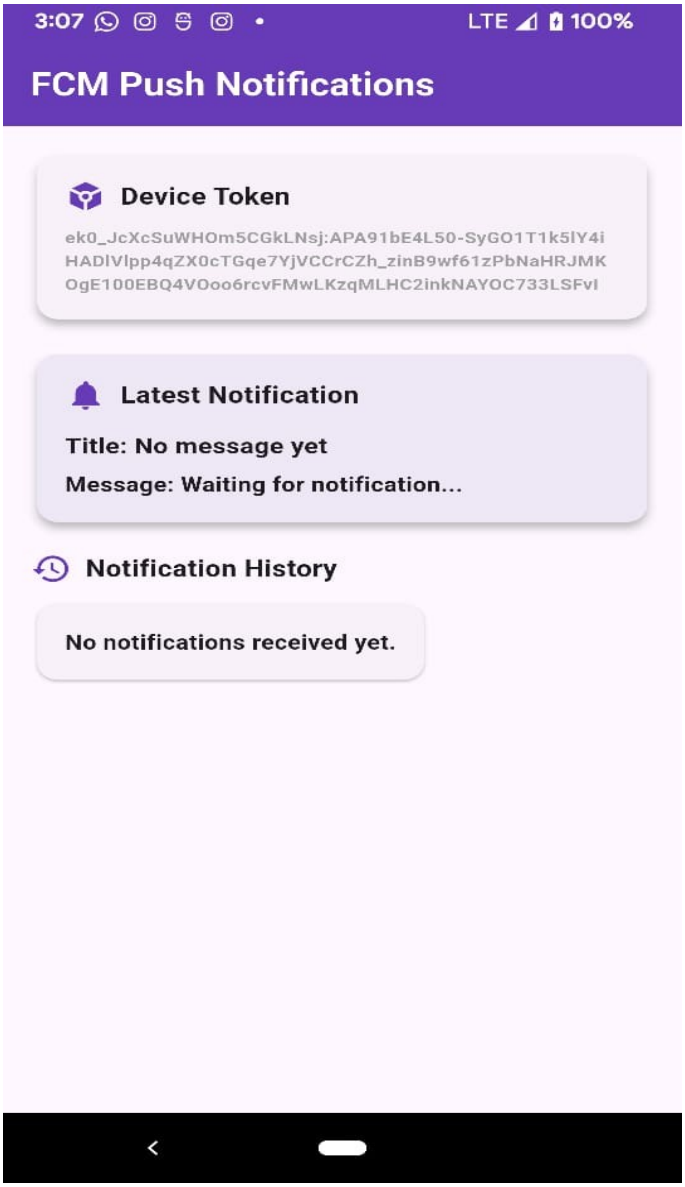
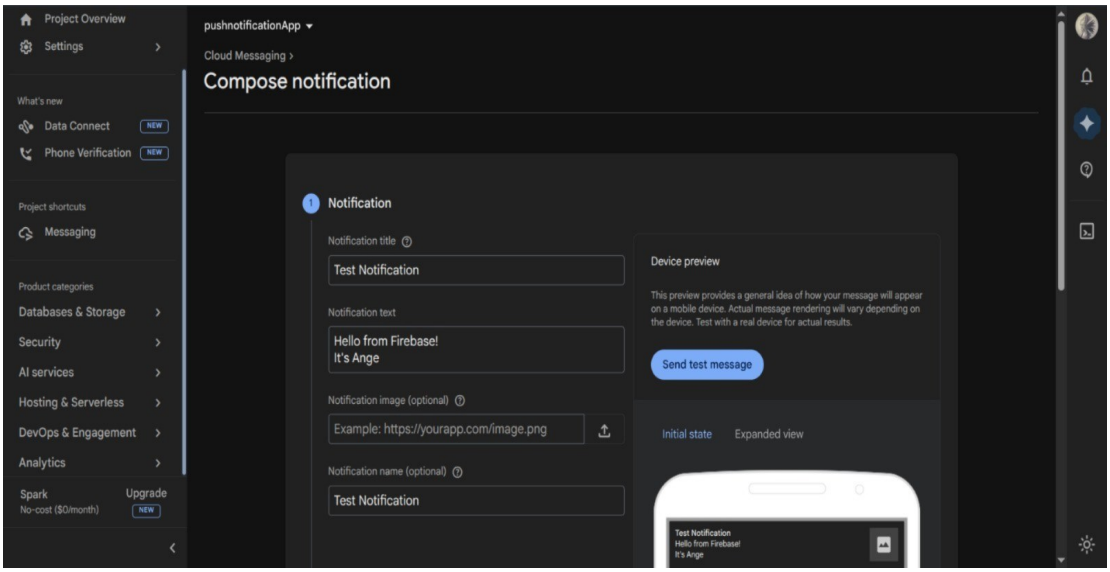
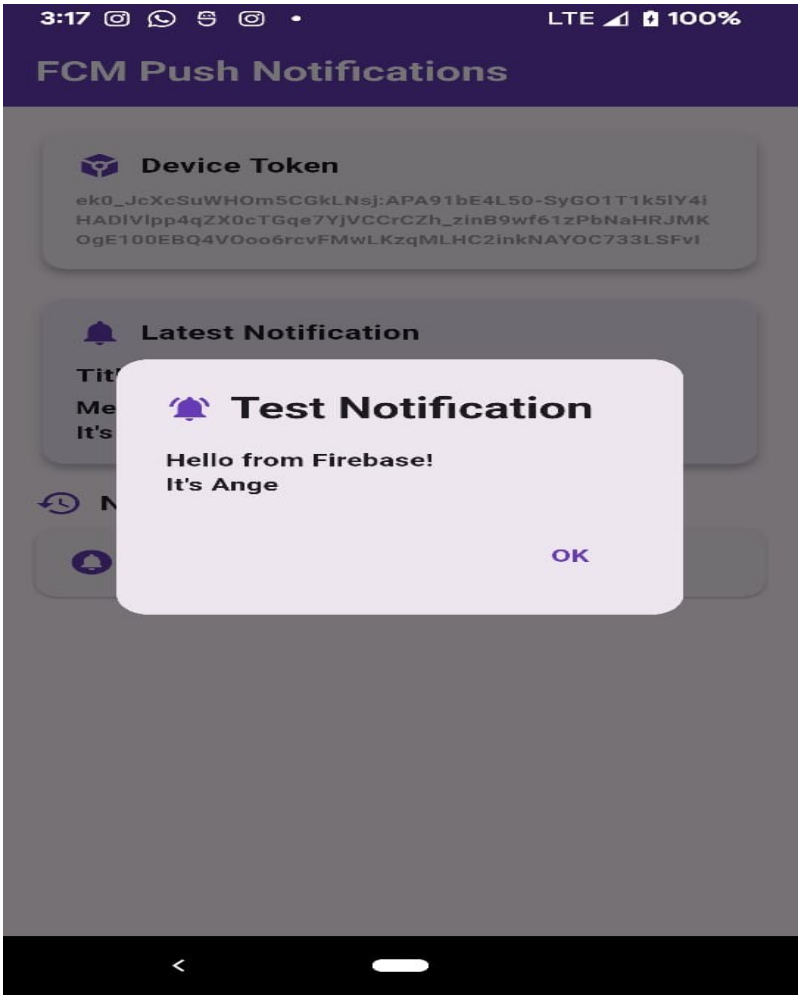
OUTPUT FOR LAB 6 PUSH NOTIFICATION



App Launch & Device Token The Flutter app is successfully launched on a real Android device. The app displays the unique FCM Device Token generated for this device, which is used by Firebase to identify and send notifications to this specific device. The Latest Notification section shows "No message yet" as no notification has been received yet.



2. Composing Notification in Firebase Console In the Firebase Cloud Messaging console, a new notification is composed with Title: "Test Notification" and Message: "Hello from Firebase! It's Ange". The device preview on the right shows how the notification will appear on Android.



3. Popup When Notification Received When the notification was sent from Firebase Console while the app was open (foreground), a popup dialog appeared immediately on screen showing the notification title and message content with an OK button to dismiss it.

4. App UI Updated After Notification After dismissing the popup, the app UI automatically updated. The Latest Notification card now shows the received title and message, and the Notification History section displays the notification that was received.

As it is shown on both of image where it updates itself.

OBSERVATIONS FROM LAB 6

① Device Token : Every android that installs the app receives a unique FCM token. and it is generated automatically by Firebase and displayed on app screen.
It is used to identify specific device when sending notifications.

② Notification Permission : When app is launched for first time it automatically request permission from user to receive notification. If user doesn't allow then it can't receive any notification.

③ Foreground & Background notification : When a notification is sent from firebase console, notification appears on top of screen and when app is running in background the notification still arrives and appears in device notification bar.

④ App UI updates : After receiving a notificate, the UI updates in real time. notificate card shows the title and message of most recent notification.

~~④ App U~~

⑤ Firebase cloud messaging console : This firebase console provides simple interface to compose and send notification to a specific devices using FCM tokens.
The message reaches the devices within seconds of being sent.
